

SQL Joins Cheat Sheet

Database Management Systems | Unit 2: SQL Basics

A join combines rows from two tables using a related column.

- INNER JOIN: only rows that match in both tables.
- LEFT JOIN: all rows from the left table, plus matches from the right (NULL when no match).
- RIGHT JOIN: all rows from the right table, plus matches from the left.
- FULL OUTER JOIN: all rows from both tables (not available in MySQL; emulate with UNION).
- Example: `SELECT s.name, c.title FROM students s INNER JOIN courses c ON c.id = s.course_id;`
